

## Lab 4: Navigation

1. Use this link to get the GitHub repo: <https://classroom.github.com/a/tg1Ho912>
2. Update the README with your name and lab 4
3. I'd suggest creating the android project in the repo directory, (otherwise you will have to copy into the repo directory anyway)
4. Choose 1 of the 3 navigation methods covered: Navigation Drawers, Bottom, or Rail
  - a. There should be three items/destinations (which don't need to be fragments).
    - i. Choose a name/label/icon for each that will show for the navigation
  - b. When the user chooses an item/destination, the main content should change to display at least that name, so it is obvious that it worked.
5. Take at least three screen captures (1 for each item/destination), showing that the app works. Also copy them into the repo.

### Turn in:

1. Make sure the readme has been updated with your name and lab 4.
2. Update the AI use section
3. Include the screenshots show the app works.
4. Make sur the app and everything has been pushed to GitHub.
